

Access, URLs and Credentials

Every address for the system, how sign-in works, the test accounts, and what must be handed over separately.

Audience	Project team and testers only
Version	1.1
Date	4 September 2026
Classification	Confidential. Contains live credentials

CONFIDENTIAL. This document contains a live administrator credential and test account credentials. Do not circulate outside the project team. The live administrator password must be changed at first sign-in. Production secrets are handed over separately.

Access, URLs and Credentials

System: Tefoma Procurement **Date:** 4 September 2026 **Classification:** Confidential. Contains live administrator and test credentials. Do not circulate outside the project team.

Handling notice

This document lists the addresses of the system, the **live administrator** credential in section 3.0, and the **test account** credentials used for demonstration and user acceptance testing.

It deliberately **does not contain** production secrets: the database connection string, the token signing secret, and the email service key. Those are held in the server environment configuration and are handed over separately, in person or through a password manager, never in a document that may be forwarded. Section 6 lists what they are so that the handover is complete.

If this document is shared with anyone outside the project team, change the passwords first, starting with the live administrator account in section 3.0.

1. Addresses

1.1 Live system

What	Address
Application	https://tefomaprocurement.vercel.app
Staff sign-in	https://tefomaprocurement.vercel.app/login
Supplier sign-in	https://tefomaprocurement.vercel.app/supplier/login
Supplier self-registration	https://tefomaprocurement.vercel.app/register
Forgotten password	https://tefomaprocurement.vercel.app/forgot-password

Staff and suppliers both start at the application address and choose their portal on the sign-in screen.

1.2 Source code

What	Address
Repository	https://github.com/sairosthedev/tefomaprocurement
Default branch	<code>main</code>

1.3 Hosting and services

Service	Purpose	Where it is administered
Vercel	Hosts the application and the interface layer	vercel.com, project owner's account
MongoDB Atlas	Hosts the database	cloud.mongodb.com, cluster 18hh61a , database fossil-procure
Resend	Sends one-time codes, password resets and workflow email	resend.com

Sender address on outbound email: Tefoma Construction Procurement <notifications@miccstech.co.zw>

1.4 Local development addresses

What	Address
Interface layer	http://localhost:3001
Application	http://localhost:5173

2. How sign-in works

Every sign-in, for staff and suppliers alike, takes three steps.

1. Enter the email address and password.
2. The system emails a six-digit code to that address.
3. Enter the code to complete sign-in.

This means **the email address on an account must be a mailbox someone can actually open**. An account with an unreachable address cannot sign in. The code expires after a short period; if it lapses, sign in again for a fresh one. Check the spam folder if it does not arrive within two minutes.

3. Accounts

3.0 Live administrator

Role	Name	Email	Password
System Administrator	Webster Maposa	Webster.Maposa@dokuma.co.zw	password

This account was created on the live system on 4 September 2026 and is active.

This password must be changed. password is the most commonly guessed credential in existence, and this account can create users, change roles, read supplier banking details and view every payment record. Anyone

who reaches the sign-in page can try it in a single guess. The emailed one-time code is the only thing standing behind it, which means the security of the whole system currently rests on one mailbox.

Change it at first sign-in through **Profile**, and choose something long and unique. Until then, treat this document as highly sensitive.

The address must be a mailbox Webster Maposa can open, because every sign-in sends a six-digit code to it.

3.1 Test accounts

All accounts in the two tables below share the password `Admin@123`.

These are seeded demonstration accounts. **Change the password on any account that is carried into live use**, and delete the rest before the system holds real commercial data.

3.2 Staff

Role	Name	Email	Department
System Administrator	System Admin	admin@fossilzim.com	—
Procurement Officer	Macdonald Sairo	macdonald@fossilzim.com	Procurement
Department Head, Procurement	John Banda	jb@fossilzim.com	Procurement
Department Head, ICT	Mac Chikwana	mac@fossilzim.com	ICT
Finance Manager	Paul Kofa	paul@fossilzim.com	Finance
Chief Operating Officer	Tino Moyo	tino@fossilzim.com	—
Stores Officer	Alfred Ncube	alfred@fossilzim.com	Stores
End User	James Mutendi	james@fossilzim.com	ICT

The two Department Head accounts are both needed. A purchase order is approved first by the head of the requesting department, Mac Chikwana for an ICT request, and then by the head of Procurement, John Banda.

3.3 Suppliers

Company	Email	Speciality
TechZone Hardware	ict.hw@techzone.co.zw	ICT hardware
CodeBridge	ict.sw@codebridge.co.zw	Software
ProFix	ict.maint@profix.co.zw	Maintenance
NetLink	ict.telecom@netlink.co.zw	Telecommunications
RadioCom	ict.radio@radiocom.co.zw	Radio equipment
Precision Cal	ict.calib@precisioncal.co.zw	Calibration

Three suppliers are needed to test the competitive quotation rule without invoking a waiver. The first three above are the ones used in the automated end-to-end test.

3.4 A note on these email addresses

These are seeded addresses on the fossilzim.com and supplier domains. If they are not mailboxes your team can open, the one-time code will not reach you and you will not be able to sign in with them.

For user acceptance testing, the reliable approach is for the administrator to create fresh accounts using email addresses your testers genuinely control, following section 4.

4. Creating your own test accounts

Sign in as the administrator, then:

- 1. Open Departments and create the departments you will use, for example ICT, Operations, Finance, Stores, Procurement. Designate a head for each.
- 2. Open Sites and confirm a head office site exists. Add a second site if you intend to test stock transfers.
- 3. Open Staff Team and add one user per role from the table in section 3.2, using real email addresses and a password of at least six characters. Assign the department, and for the stores officer a home site.
- 4. Open Suppliers and add at least three, each with a real contact email address, then complete and verify their compliance documentation so they reach active status.

Record what you create. A simple table of name, email, role and password, kept somewhere secure, saves considerable time.

Role	Email	Password	Notes
End User			
Department Head, requesting department			
Department Head, Procurement			
Stores Officer			
Procurement Officer			
Finance Manager			
Chief Operating Officer			Only needed above USD 5,000
Supplier A			
Supplier B			
Supplier C			

5. Existing test data to be aware of

The live system currently holds leftover data from earlier testing. Supplier records whose names begin `SPLIT-`, `SMOKE-` or `NEG-` are artefacts of automated test runs, not real vendors. They should be removed before the system goes into commercial use.

6. Production secrets, handed over separately

The following are held in the server environment configuration. They are **not** reproduced here. Confirm you have received each one before treating the handover as complete.

Setting	What it is	Held where
<code>MONGODB_URI</code>	Database connection string, including credentials	Vercel project environment variables, and MongoDB Atlas
<code>JWT_SECRET</code>	The key used to sign session tokens. Anyone holding it can forge a session as any user	Vercel project environment variables
<code>RESEND_API_KEY</code>	The key used to send email, including one-time codes	Vercel project environment variables, and the Resend account
Vercel account	Deployment and hosting control	Project owner's account
MongoDB Atlas account	Database administration, backups, network access rules	Project owner's account
Resend account	Email sending domain and reputation	Project owner's account
GitHub repository access	Source code	github.com/sairosthedev

Non-secret configuration in the same file, recorded here for completeness: the port, environment name and log level; the token lifetime; the company and product names used in branding; the application address used in email links; and the settings governing scheduled alerts, being whether they run, how often, the de-duplication window, how far ahead RFQ deadlines are flagged, and the default low-stock threshold.

6.1 Recommended actions on handover

1. Rotate the token signing secret and the email service key, so that anyone who saw them during development no longer holds working credentials.
2. Create a database user for the application with only the permissions it needs, and restrict network access to the hosting provider.
3. Change the live administrator password in section 3.0. This is the most urgent item on this list.
4. Change the password on every seeded account that will remain in use, and delete the rest.
5. Remove the leftover test supplier records described in section 5.
6. Confirm that at least two people in the company hold the hosting and database account credentials, so the system is not dependent on one individual.

7. Support and escalation

Need	Contact
Account creation, password reset, role change	System administrator
A defect or unexpected behaviour	Project team, following the reporting format in the tester guide
Hosting, database or email service issues	Project owner

Companion documents: Executive Briefing, Business Requirements Document, Tester Guide, System Overview.
