

Tefoma Procurement — End-to-End Test Report

Full procurement lifecycle verified against the live production system, with the new **equipment identification & data-plate photo** capability exercised end to end.

Date	21 July 2026
Environment	Live production — <code>tefomaprocurement.vercel.app</code> / <code>tefomaprocurement-api.vercel.app</code>
Method	Real browser (Chrome, 1440×1000) driven end to end; every screenshot below is an unedited capture of the live system
Test data marking	Every record created is prefixed <code>[TEST-E2E]</code>
Screenshots	58

1. Executive summary

A single work request was carried through **every stage** of the procurement lifecycle — from an operator on site raising it, to the supplier being paid. The scenario was chosen to exercise the new equipment feature realistically: a **JCB 3CX backhoe at the Mbudzi Interchange site** is down with a leaking hydraulic pump, and the requester does not know the part number, so they photograph the machine's data plate instead.

Stage	Record created	Result
1. Requisition raised (end user)	PR-2026-00014	Passed
2. Department head approval	PR-2026-00014	Passed
3. Stores review	PR-2026-00014	Passed
4. RFQ issued to suppliers	RFQ-2026-00014	Passed
5. Supplier quotation (alternative part)	QT-2026-00014	Passed
6. Purchase order + 3-stage approval	PO-2026-00008	Passed
7. Supplier acknowledgement	PO-2026-00008	Passed
8. Goods received (GRV)	GRV-2026-00005	Passed
9. Invoice	INV-2026-00003	Passed
10. Payment	\$322.25	Passed

Outcome: the full lifecycle completed successfully. The requisition ended as a **paid invoice with a zero balance**. The new equipment fields and data-plate photos travelled intact from the requisition, into the RFQ, through to the supplier's screen, and back into the quotation.

2. What the new feature does (and why it matters)

Before this change, a request for a plant spare arrived at the supplier as little more than a line of text — "hydraulic pump seal kit". A parts counter cannot fill that order: seal kits differ by machine build, and the exact serial is what determines the right variant.

The new capability adds **ten optional identification fields** and **photo attachments** to each requisition line:

Field	Why it is there
Make / Model	Basic machine identity
Plant / fleet number	Your internal asset tag (e.g. FC-EX-014) — used for costing and job cards
Registration number	Road-going vehicles
Chassis / VIN	Trucks, tippers, bowsers, LDVs (17-character VIN)
Machine serial / PIN	The single most reliable identifier on plant — from the data plate
Engine number	Engines get swapped between chassis; filters and injectors key off this, not the machine
Component serial	Major assemblies (transmission, pump) carry their own plates
Part number (OEM)	Used when already known
Hours / odometer	Service-interval parts and warranty validation

Two design decisions worth highlighting to reviewers.

- a) Nothing is mandatory.** Data plates on older fleets are routinely painted over, corroded, or missing. Had serial been compulsory, requisitions would stall on site. Instead the requester fills in what they can and attaches a photo.
- b) Separate boxes, not one comma-separated field.** Each identifier is stored independently, so values stay searchable and print as labelled rows on every downstream document.

3. The test scenario

Machine	JCB 3CX Sitemaster backhoe, plant no. FC-EX-014
Site	Mbudzi Interchange
Fault	Leaking hydraulic pump — machine down
Line 1	Hydraulic pump seal kit ×2 — <i>with</i> full machine identification and a data-plate photo
Line 2	A4 Bond Paper ×5 — deliberately <i>without</i> equipment data, to prove ordinary office requests stay simple

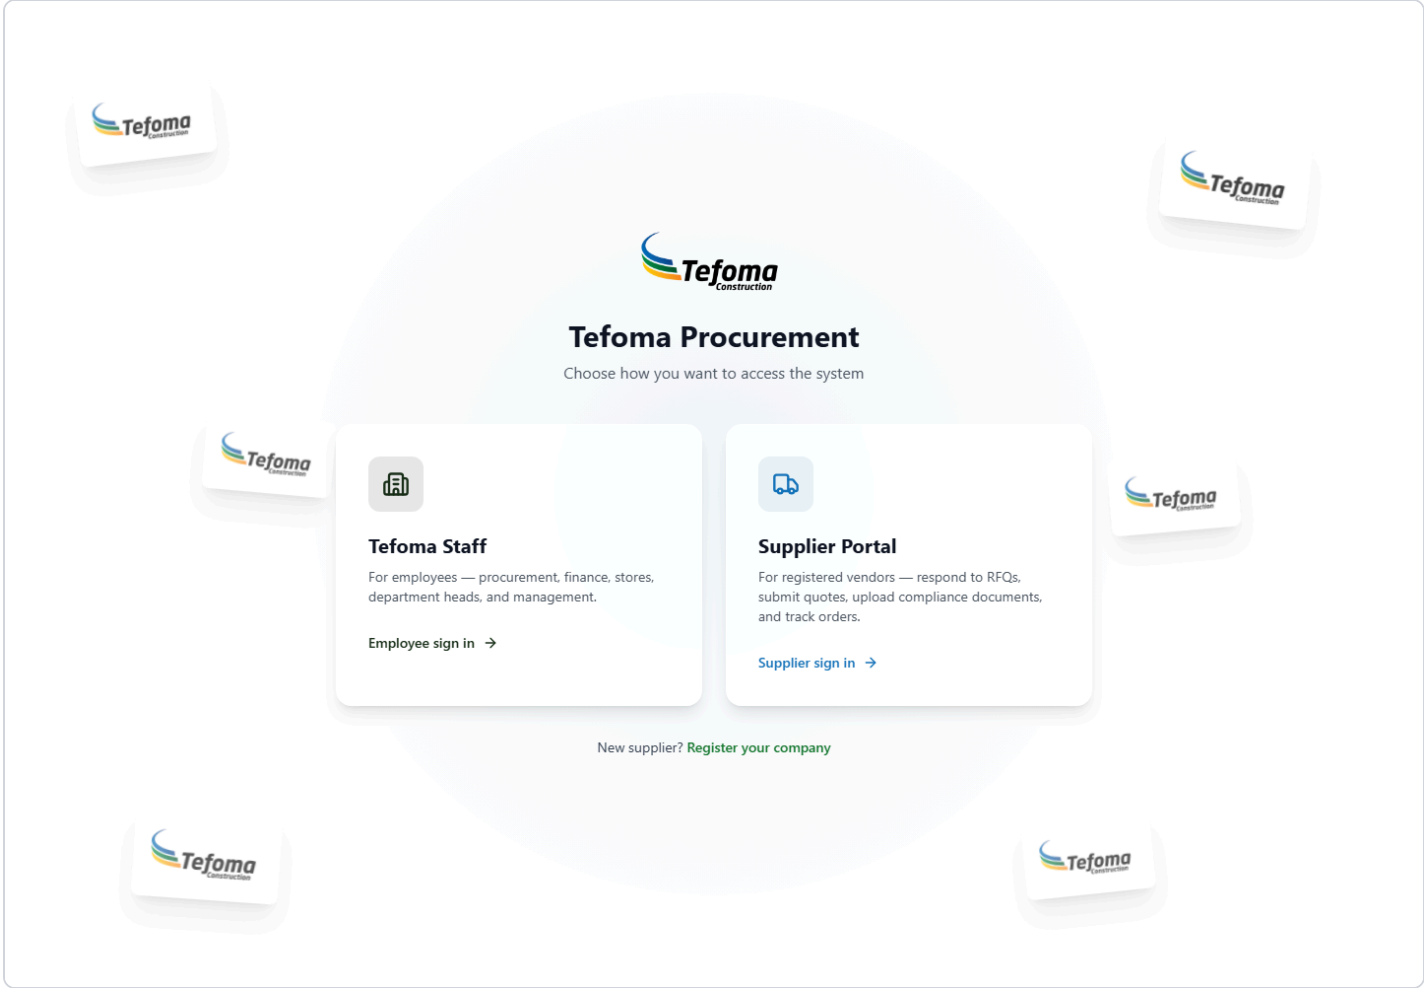

4. Stage-by-stage walkthrough

4.1 Login and portal

The system separates staff and supplier entry points. Every login is protected by a one-time code sent to the user.

Portal landing page

Staff and supplier users are routed separately.

Staff sign-in

Employee sign-in for Tefoma staff.

Supplier sign-in

Separate supplier portal login.

The image shows a login form for the Tefoma Construction Supplier Portal. The form is centered on a light blue and green gradient background. It features the Tefoma Construction logo at the top, followed by the title 'Supplier Portal' and a description of its functions: 'Manage RFQs, quotations, compliance documents, and deliveries'. Below this are input fields for 'Email Address' (containing 'you@example.com') and 'Password' (with a 'SHOW' button). A dark green 'Continue' button is positioned below the password field. At the bottom, there are links for 'New supplier? Register your company' and 'Tefoma employee? Staff sign in'. A back arrow link is located at the very bottom of the form.

4.2 The operator raises the requisition

The requester adds the two lines. For the seal kit they open the optional *Equipment details & photos* panel and record the machine, then attach the data plate.

Create Requisition form

The equipment panel is offered on every line but stays collapsed for ordinary items.

4.7 Supplier offers an equivalent part

The supplier does not stock the genuine JCB kit, but has an OEM-interchangeable Donaldson equivalent. They flag the line as an alternative, give its part number, and **upload the data plate of the part they would actually supply.**

Quotation QT-2026-00014 as procurement sees it

The amber panel warns that this is not the exact part requested, names the equivalent, gives part number P552100-EQ, and shows the data plate supplied by the vendor.

teste2e.supplier.149375@tefoma-test.local
Submitted: 7/21/2026, 10:23:35 PM

Notes

[TEST-E2E] Offering an OEM-interchangeable equivalent; data plate of the offered part attached.

Verified: the alternative flag, description ("Donaldson equivalent seal kit (OEM-interchangeable)"), part number P552100-EQ, and a real image payload were all stored and are shown to the buyer before award.

4.8 Purchase order and the approval chain

The PO passes through Department HOD → Procurement HOD → Finance. Because the order is \$370.59, COO authorisation is correctly *not* required.

Purchase order PO-2026-00008 — fully approved

All three required approvals recorded; the fourth stage reads "Not required (below USD 5,000)".

5. Controls confirmed working

Several safeguards blocked the test at the right moments. These are *successes*, not defects — each one is evidence that the system enforces procurement policy.

Control	What happened
Sealed bidding	Quotations were hidden behind "Bid is sealed" until the RFQ closed, preventing early sight of a competitor's price.
KYS compliance gate	A supplier could not be activated with incomplete KYS (0/16 items). Activation required an explicit, reasoned override, which was recorded.
Three-way match	Finance could not approve an invoice whose value did not match the PO and GRV without a documented force-approval.
COO threshold	COO authorisation correctly skipped at \$370.59 (below USD 5,000).
Two-stage HOD approval	Requesting-department HOD and Procurement HOD are separate, sequential gates.
Role separation	A supplier attempting a staff-only page received "Access Denied".

6. Findings and recommendations

Finding 1 — "INSPECTED BY" is never filled in on the GRV Medium

The printed GRV has three signature blocks: Delivered By, Received By and Inspected By. The first two are populated. **Inspected By prints as "—"**.

The cause is that a delivery received in full is accepted automatically, so the separate inspection step never runs. Checking every delivery in the system confirmed this is not specific to our test: **0 of 5 deliveries have an inspector recorded**.

Recommendation: either capture the inspector's name at the point of receipt (alongside the delivered-by details), or require an explicit inspection before acceptance. As it stands the printed GRV cannot evidence who checked the goods, which is usually the point of the document.

Finding 2 — Requisitions can bypass the stores check Low

Raising an RFQ against a requisition that is still in *stores review* moves it straight to sourcing, skipping the stores step. In our run this happened because procurement acted before stores had responded.

Recommendation: confirm this is intended. If stores should always get first refusal — to avoid buying what is already on the shelf — the RFQ action should be blocked until stores has released the requisition.

Finding 3 — Housekeeping Low

The production database contains test artefacts from earlier development work (suppliers prefixed `SPLIT-`, `SMOKE-`, `NEG-`). Worth a clean-up before any demonstration to an external audience.

7. Test data created and cleaned up

Every record created is marked `[TEST-E2E]`. All nine temporary accounts were **deactivated** at the end of the run, and the temporary supplier profile was **suspended** so it can never be invited to a real RFQ.

Record	Reference	Final state
Requisition	PR-2026-00014	Completed through to payment
RFQ	RFQ-2026-00014	Awarded
Quotation	QT-2026-00014	Accepted
Purchase order	PO-2026-00008	approved
Goods received voucher	GRV-2026-00005	Accepted into stock
Invoice	INV-2026-00003	paid (balance \$0.00)
Temporary accounts (9)	<code>*@tefoma-test.local</code>	All deactivated

One earlier probe record, `PR-2026-00013`, was created to confirm the deployed API accepts the new fields; it was cancelled immediately and never entered any approval queue.

8. Conclusion

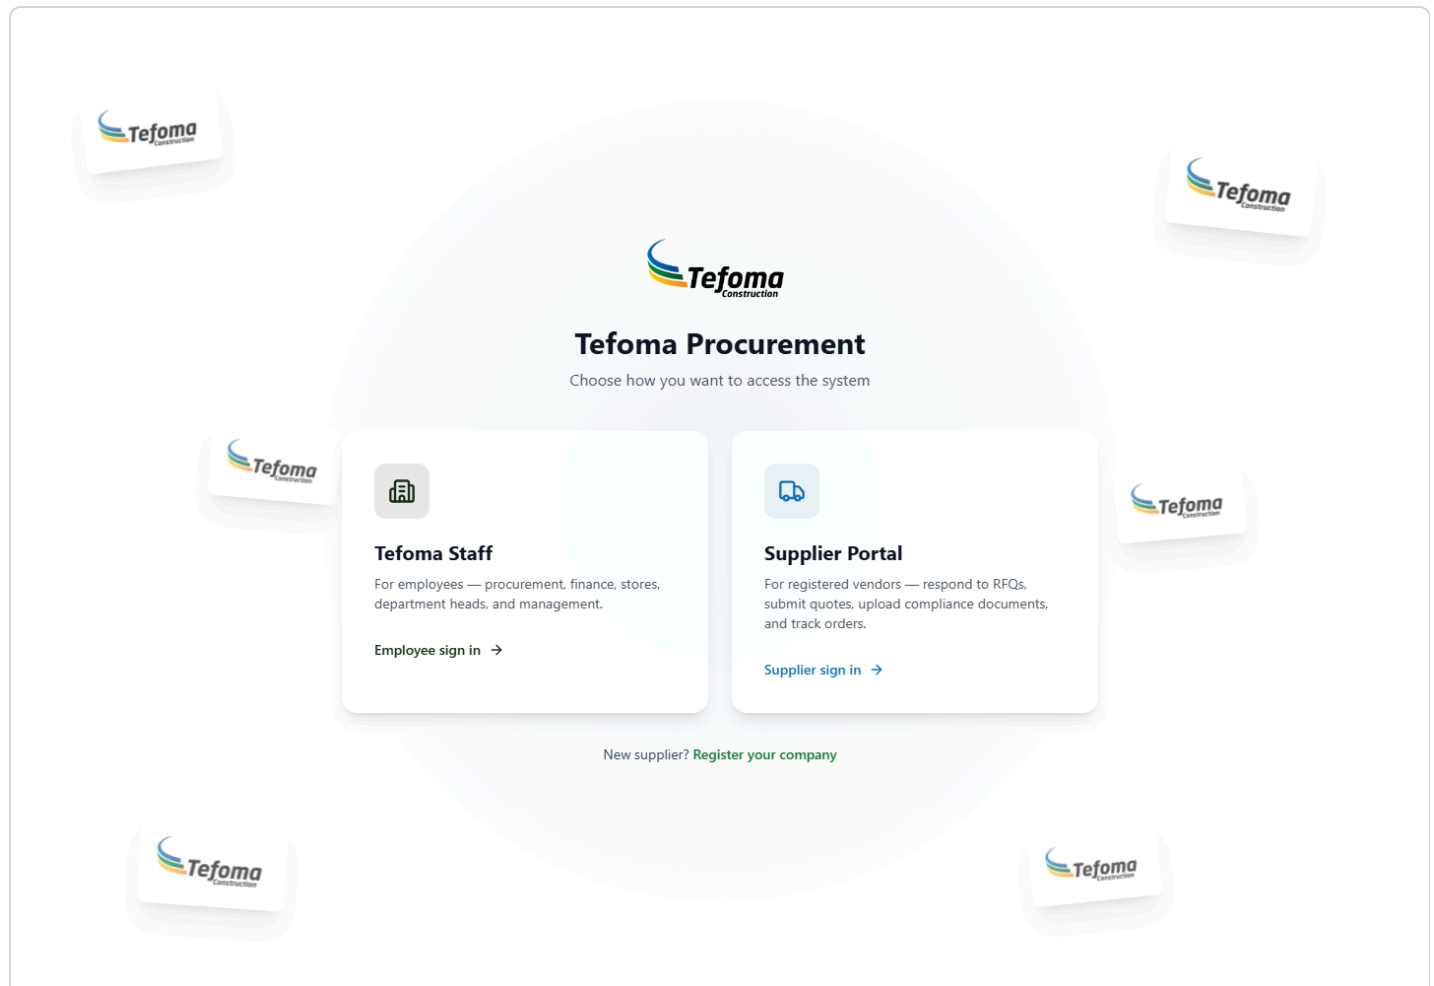

The equipment identification and data-plate feature works as designed, in production. A site operator can now identify a machine precisely without knowing the part number; that information reaches the supplier intact; and a supplier offering an equivalent part must show the buyer exactly what they intend to supply. Ordinary office requisitions are unchanged.

The full procure-to-pay lifecycle completed successfully, and the policy controls (sealed bidding, KYS, three-way match, approval thresholds) all held. One medium-severity gap — the empty *Inspected By* field on the GRV — is recommended for attention before rollout.
